

YOUR RIDE, YOUR HEALTH

Gvc Tuesday

One bike ride, two workouts in one — a cardio session and a strength session, back to back. Good for every rider, whatever your age.

Where the workout changed

This is the real route on a real map, out through Garforth, Kippax and Ledston to Fairburn Ings and Monk Fryston. Two named spots stand out.

- Cardio — flat & rolling
- Strength — climbing
- Recovery — coasting down

The same route, laid out flat (height above sea level)

What each part actually did for you

**BEST SPOT: HILLAM & MONK
FRYSTON**

Cardio — the steady heart workout

On the flat sections — like the low-lying lanes out past Fairburn Ings towards Hillam and Monk Fryston, barely above sea level — you settled into a strong, steady rhythm you could hold for a long time. This is what trains your heart and lungs to work more efficiently.

24.7 km **53 min**

FLAT, ALL ROUTE TIME SPENT

28 km/h **147 bpm**

STEADY PACE AVG HEART RATE

**BEST SPOT: CAUDLE HILL,
FAIRBURN**

Strength — the muscle workout

Going uphill — like the climb up Caudle Hill near Fairburn, where your heart rate hit its peak for the whole ride — your pedal stroke slowed but got much harder, pushing your body weight against gravity over and over. That's real resistance training, no gym required.

8.8 km **26 min**

TOTAL HEIGHT GAINED PEAK EFFORT

Two workouts beat one — for every rider

Steady flat riding builds a strong heart. Climbing builds strong muscles and bones. Riders of any age benefit from both — but the strength side becomes especially important after 50, when the body naturally starts losing muscle and bone density faster.

Keeps muscle you'd otherwise lose

Pushing hard on a climb is resistance training. It tells your legs to hold on to strength instead of quietly losing it year after year — muscle loss that speeds up noticeably from your 50s on.

Loads your bones, for stronger bones

Grinding up a hill puts real force through your hips and legs — the kind of load that helps keep bones dense as you age.

Better balance, fewer falls

The strength and control built climbing carries straight into everyday stability — getting up, carrying things, steady footing.

A metabolism that stays active

Muscle burns energy even at rest. Keeping it means your body stays more efficient, not less, as the years go on.

THE TAKEAWAY

You didn't just go for a bike ride — you did a full workout

The flats trained your heart. The hills trained your muscles and bones. Remember the pattern: **Hillam & Monk Fryston** for a cardio spin, **Caudle Hill, Fairburn** when you want the strength session. Great for any rider, any age.
